

Your P&L Monitor — Plain-English Guide

Quick-reference for day-to-day use. For setup or technical detail, see `MANUAL.md` instead — this one skips all of that.

1. What it does

It watches your Zerodha account continuously, about once a second, and sends you a Telegram message whenever something worth knowing happens — a profit or loss milestone, a stop-loss getting placed, or a threshold being crossed. On top of watching, it also runs two things automatically on your behalf: it sells a small NIFTY options trade every trading day around **9:23am** and closes it by **3pm**, and once a week it buys a cheap "insurance" option that reduces how much margin (money set aside by your broker) the daily trade needs. If your **manual** trading loses or gains more than the limits you've set, it will automatically close those positions for you rather than wait for you to act. Everything else you trade yourself — it just protects those trades with automatic stop-losses and watches your overall P&L.

Important: the daily NIFTY trade and the weekly hedge run in a completely separate bucket. The ₹ thresholds in section 2 below only look at your manual trading — the automated trade's own profit/loss never counts toward them, and none of the automatic closes described below ever touch the automated trade or its hedge. It's protected by its own, separate stop-loss instead (see the "Daily NIFTY trade" row).

2. Current default settings

Setting	Currently set to	What it means in practice
First loss warning	₹20,000 down (manual only)	You get a warning message. Nothing is closed automatically.
Second loss warning	₹30,000 down (manual only)	A stronger warning, suggesting you cut position size in half. Still nothing closed automatically.
Hard loss stop	₹40,000 down (manual only)	All your manual/other positions get closed automatically, right away. The automated NIFTY trade and its hedge are a separate bucket and are never touched by this.
Profit target	₹80,000 up (manual only)	All your manual/other positions get closed automatically to lock in the win. The automated NIFTY trade and its hedge are never touched by this.
Profit check-in step	Every ₹5,000	An update every time your manual-trading running total crosses another ₹5,000, either direction, until the trailing lock takes over.
Trailing lock starts	Manual trading ₹40,000 up	From here it tracks your highest profit point of the day and protects a chunk of it — see section 3.

Early "green day" floor	Arms at ₹20,000 up, floor at ₹5,000 (manual only)	A gentler, earlier net that only applies before the trailing lock has kicked in. Falls back to ₹5,000 → your manual positions close — the automated trade is untouched.
Cool-off after a forced exit	15 minutes	After any automatic close above, a new manual position opened within 15 minutes gets auto-closed again too.
What counts as a "hedge" among your manual trades	Priced under ₹5	Among your own manual positions, cheap ones are assumed to be insurance, not real bets — never touched by any auto-close rule above. (The automated trade's weekly hedge is separate again.)
Big-position alert	1,950 units (~30 lots)	A warning if any single position gets this large. Nothing closes automatically — just a heads-up.
"Still alive" check-in	Every 60 minutes	Even on a totally quiet day, a message confirms the monitor is still running.
Daily NIFTY trade	On, 5 lots/day (2 on expiry day)	Sells a near-the-money call and put automatically each morning ~9:23am, protected by its own stop-loss, closed by 3pm.
Weekly protective hedge	On, 5 lots/week	Buys a cheap far-out option once a week (Wednesday) that lowers the margin needed for the daily trade. Held all week.

There are also a handful of behind-the-scenes technical knobs — retry timing, order buffer percentages, file locations — that don't change what you see or how much is at risk day-to-day, so they're left out of this table on purpose.

3. What happens if you change a setting

- **Loss warnings / hard loss stop** — Lower the ₹ amount and it reacts sooner (safer, but a wobble stops you out more easily). Raise it and you give yourself more room to be wrong before your manual positions are forced closed. Measured on manual trading only — no effect on the automated NIFTY trade.
- **Profit target** — Lower it and you lock in wins earlier but leave more on the table on a good day. Raise it and winners run longer, at the risk of giving more back. Same scope note — manual trading only.
- **Trailing lock start point** — The point where "every ₹5,000" updates stop and active peak-profit protection begins. Lower it and protection kicks in sooner on a smaller win; raise it and you need a bigger win first.
- **Green day floor** — Only matters early in the day, before the trailing lock has armed. Raising the floor protects more of an early gain; lowering it gives a small early profit more room before anything closes.
- **Cool-off minutes** — Longer means more of a forced timeout after a big stop-loss or target hit before you can trade freely again. Shorter gets you back to normal sooner.
- **What counts as a hedge (₹5 threshold)** — Raise it and more cheap positions get ignored by the safety nets. Lower it and fewer positions get that pass — only genuinely near-worthless ones.
- **Daily NIFTY trade lots** — More lots means more premium collected on a good day, and a proportionally bigger loss on a bad one. Not a small tweak — it directly scales your risk every single trading day.

- **Weekly hedge lots/distance** — More lots on the hedge costs more upfront but caps risk further out; moving it closer to your daily trade's strikes is cheaper margin but a tighter (and pricier) hedge. Not yet fine-tuned against real numbers — treat as experimental.

4. What messages you'll actually receive

Normal day, nothing unusual

 Strangle entry in ~2 min
Selling today's 1-OTM CE+PE at 9:23 IST.

 Strangle entry orders placed
SOLD NIFTY2582624650CE x325 & NIFTY2582624550PE x325
Spot: Rs 24,612.30 | Expiry: 2026-08-26
Awaiting fill confirmation...

 Heartbeat
Monitor alive. Positions: 2 | P&L: Rs 1,240.50

 EOD SUMMARY — 2026-08-15
Final P&L: Rs 3,180.00
Peak: Rs 4,050.00 | Trough: Rs -620.00
Gave back Rs 870.00 from the day's peak

Loss threshold hit

 Loss warning — Rs 20k down
P&L is Rs -21,340.00. Stay cautious.

 Loss limit Rs -40,000 hit — exited
Exited: BANKNIFTY2582651000PE
Cool-off: new positions auto-squared-off until 11:47:03

(This only ever lists your own manual positions — never the automated NIFTY trade or its hedge, which aren't included in this ₹ total at all.)

Profit threshold hit

 Profit target Rs 80,000 hit — exited
Exited: BANKNIFTY2582651000PE
Cool-off: new positions auto-squared-off until 13:02:15

Something going wrong

 Access token error
Incorrect `api\_key` or `access\_token`.
Run generate_token.py and restart the service.

Worth knowing: that token-error message only fires if the connection to your broker fails right when the monitor starts up. If the connection drops mid-day instead, it does **not** proactively message you — it just quietly keeps showing the last numbers it had until the connection comes back. In practice this is rare, since the token refreshes automatically every weekday morning.

5. What you need to do each day

Nothing, normally. The daily login/token refresh happens automatically every weekday morning before the market opens, and you'll get a Telegram message either way:

-  a success message once it's refreshed and the monitor's restarted, or
-  a failure message if it didn't work — the one case where you'd need to step in and sort out the login yourself.

Everything else — the daily trade, the weekly hedge, the stop-losses, the safety nets — runs on its own. Your only *optional* daily habit is glancing at Telegram in the morning to confirm you got the , and checking in occasionally during the day if you want a live read.

6. Quick answers to obvious questions

Does it place trades for me, or just tell me?

Both, depending on what you mean. The daily NIFTY trade and the weekly hedge are fully automatic — it decides the strikes, places the orders, and manages the stop-loss without you doing anything, and these run completely separately from everything below. For everything *else* you trade yourself, it never opens a new position on its own — it only protects what you've already opened (automatic stop-loss, and closing those manual positions if one of the ₹ thresholds is hit).

What happens if the morning login step fails — does it just stop silently, or tell me?

It tells you. You'll get a Telegram message saying the automatic login failed, and at that point you'd need to log in manually yourself before the monitor can do anything that day.

Does it keep alerting me every few minutes once a threshold is hit, or just once?

Depends which one. The hard stops (loss limit, profit target, green-day floor) each fire once and take action immediately. The trailing-lock breach is the one exception — if your peak profit gives back too much, it repeats an urgent "still below the floor" alert every 15 seconds until it either recovers or auto-closes, so it can't be missed.

What happens over the weekend or on a market holiday?

Nothing trades. No new positions get opened, and you won't get milestone or heartbeat messages either — the monitor just sits quietly until the next real trading day. It knows about specific NSE holidays as well as weekends, so it won't try to trade on those either.

Can I temporarily switch things off without asking for help touching the server?

Yes — send `/pause` (stops auto-closing), `/pause_sl` (stops new stop-losses), `/pause_strangle` or `/pause_hedge` (stops tomorrow's/next week's automatic trade), or `/stop` (mutes all messages). Each has a matching `/resume_*` or `/start` to switch it back on. Send `/help` any time for the full list, or `/status` for a live snapshot right now.
